- Event-B archives related to tutorials.

Current Summary

- ① Correctness by Construction
- ② The refinement of models
- ③ Example of the factorial function refined into an algorithm
- ④ Stop cours
- ⑤ Summary on Event-B .
- ⑥ Transformations of EVENT B models
- ⑦ Intermezzo
- ⑧ The Inductive Paradigm
- ⑨ Conclusion

Correctness by Construction

- Correctness by Construction is a method of building software-based systems with **demonstrable correctness** for security- and safety-critical applications.
- Correctness by Construction advocates a **step-wise refinement** process from specification to code using tools for checking and transforming models.
- Correctness by Construction is an approach to software/system construction
 - ▶ starting with an abstract model of the problem.
 - ▶ progressively adding details in a step-wise and checked fashion.
 - ▶ each step guarantees and proves the correctness of the new concrete model with respect to requirements

The Cleanroom Method as CbC

- The **Cleanroom** method, developed by Harlan Mills and his colleagues at IBM and elsewhere, attempts to do for software what cleanroom fabrication does for semiconductors : to achieve quality by keeping defects out during fabrication.
- In semiconductors, **dirt** or **dust** that is allowed to **contaminate** a chip as it is being made cannot possibly be removed later.
- But we try to do the equivalent when we write programs that are full of bugs, and then attempt to remove them all using debugging.

The Cleanroom Method as CbC

The Cleanroom method, then, uses a number of techniques to develop software carefully, in a well-controlled way, so as to avoid or eliminate as many defects as possible before the software is ever executed. Elements of the method are :

- specification of all components of the software at all levels ;
- stepwise refinement using constructs called "box structures" ;
- verification of all components by the development team ;
- statistical quality control by independent certification testing ;
- no unit testing, no execution at all prior to certification testing.

Overview of Methodology

- Informal Requirements : Restricted form of natural language.
- Formal Specification : Modeling language like Event-B , Z, ASM, VDM, TLA+...
- Formal Verification : Theorem Prover Tools like PVS, Z3, SAT, SMT Solver...
- Formal Validation : Model Checker Tools like ProB, UPPAAL , SPIN, SMV ...
- Real-time Animation : **Our proposed approach ... Real-Time Animator ...**
- Code Generation : **Our proposed approach ... EB2ALL : EB2C, EB2C++, EB2J, EB2C# ...**
- Acceptance Testing : Failure Mode, Effects and Critically analysis(FMEA and FMEA), System Hazard Analyses(SHA)

Current Summary

- ## 9 Conclusion

- Systems are generally very complex
- Invariant should be strong enough for proving safety properties
- Problems for modelling : finding suitable mathematical structures, listing events or actions of the system, proving proof obligations, ...

Solution : refining models

- To understand more and more the system
- To distribute the complexity of the system
- To distribute the difficulties of the proof
- To improve explanations
- Validation (step by step)
- Refinement (invariant & behavior)

Refinement of a model by another one

Refinement of a model by another one (I)

Refinement of a model by another one (II)

(REF1) : refinement of initial conditions

$$\text{INITC}(y) \Rightarrow \exists x * (\text{INIT}(x) \wedge \mathbf{J}(x, y)) :$$

The initial condition of the refinement model imply that there exists an abstract value in the abstract model such that that value satisfies the initial conditions of the abstract one and implies the new invariant of the refinement model.

(REF2) : refinement of events

$$I(x) \wedge J(x, y) \wedge ce(y, y') \Rightarrow \exists x'. (ae(x, x') \wedge J(x', y')) :$$

The invariant in the refinement model is preserved by the refined event and the activation of the refined event triggers the corresponding abstract event.

(REF3) : refinement of stuttering steps

$$I(x) \wedge J(x, y) \wedge ce(y, y') \Rightarrow J(x, y') :$$

The invariant in the refinement model is preserved by the refined event but the event of the refinement model is a new event which was not visible in the abstract model ; the new event refines *skip*.

(REF4) : Refinement does not introduce more blocking states

$$I(x) \wedge J(x, y) \wedge (G_1(x) \vee \dots \vee G_n(x)) \Rightarrow H_1(y) \vee \dots \vee H_k(y) :$$

The guards of events in the refinement model are strengthened and we have to prove that the refinement model is not more blocked than the abstract.

(REF5) : Well-definedness of variant

$$I(x) \wedge J(x, y) \Rightarrow V(y) \in \mathbb{N}$$

(REF6) : Well behaviour of new events

$$I(x) \wedge J(x, y) \wedge ce(y, y') \Rightarrow V(y') < V(y) :$$

New events should not block forever abstract ones.

(REF7) : Feasibility of refined events

$$\Gamma(s, c) \vdash I(x) \wedge J(x, y) \wedge \text{grad}(E) \Rightarrow \exists y' \cdot P(y, y')$$

Current Summary

- ## 9 Conclusion

Current Summary

Simple Form of an Event

- An event of the **simple** form is denoted by :

$\langle event_name \rangle \hat{=}$ WHEN $\langle condition \rangle$ THEN $\langle action \rangle$ END

where

- $\langle event_name \rangle$ is an identifier
- $\langle condition \rangle$ is the firing condition of the event
- $\langle action \rangle$ is a generalized substitution (**parallel** “assignment”)

Non-deterministic Form of an Event

- An event of the **non-deterministic** form is denoted by :

```
< event_name >  $\hat{=}$   
  ANY < variable > WHERE  
    < condition >  
  THEN  
    < action >  
  END
```

where

- < *event_name* > is an identifier
- < *variable* > is a (list of) variable(s)
- < *condition* > is the firing condition of the event
- < *action* > is a generalized substitution (**parallel** “assignment”)

Shape of a Generalized Substitution

A generalized substitution can be

- **Simple** assignment : $x := E$
- **Generalized** assignment : $x : |P(x, x')$
- **Set** assignment : $x \in S$
- **Parallel** composition : $\begin{matrix} T \\ \dots \\ U \end{matrix}$

$$\text{INVARIANT} \wedge \text{GUARD} \implies \text{ACTION establishes INVARIANT}$$

Invariant Preservation Verification (1)

- Given an event of the simple form :

```
EVENT e ≐  
  WHEN  
    G(x)  
  THEN  
    x := E(x)  
  END
```

and invariant $I(x)$ to be preserved, the statement to prove is :

$$I(x) \wedge G(x) \implies I(E(x))$$

Invariant Preservation Verification (2)

- Given an event of the simple form :

EVENT $e \triangleq$
WHEN
 $G(x)$
THEN
 $x : |P(x, x')$
END

and invariant $I(x)$ to be preserved, the statement to prove is :

$$I(x) \wedge G(x) \wedge P(x, x') \implies I(x')$$

Invariant Preservation Verification (3)

- Given an event of the simple form :

```
EVENT e ≐  
  WHEN  
    G(x)  
  THEN  
    x :∈ S(x)  
  END
```

and invariant $I(x)$ to be preserved, the statement to prove is :

$$I(x) \wedge G(x) \wedge x' \in S(x) \implies I(x')$$

Invariant Preservation Verification (4)

- Given an event of the non-deterministic form :

```
EVENT e  $\hat{=}$   
  ANY v WHERE  
    G(x, v)  
  THEN  
    x := E(x, v)  
  END
```

and invariant $I(x)$ to be preserved, the statement to prove is :

$$I(x) \wedge G(x, v) \implies I(E(x, v))$$

Refinement Technique (1)

- Abstract models works with variables x , and concrete one with y
- A **gluing invariant** $J(x, y)$ links both sets of vrbls
- Each **abstract event** is refined by **concrete one** (see below)

Refinement Technique (2)

- Some **new events** may appear : they refine “skip”
- Concrete events **must not block more often** than the abstract ones
- The set of new event alone **must always block eventually**

Correct Refinement Verification (1)

- Given an **abstract** and a corresponding **concrete** event

```
EVENT ae ≐  
  WHEN  
    G(x)  
  THEN  
    x := E(x)  
  END
```

```
EVENT ce ≐  
  WHEN  
    H(y)  
  THEN  
    y := F(y)  
  END
```

and invariants $I(x)$ and $J(x, y)$, the statement to prove is :

$$I(x) \wedge J(x, y) \wedge H(y) \implies G(x) \wedge J(E(x), F(y))$$

Correct Refinement Verification (2)

- Given an **abstract** and a corresponding **concrete** event

```
EVENT ae ≡  
  ANY v WHERE  
    G(x, v)  
  THEN  
    x := E(x, v)  
  END
```

```
EVENT ce ≡  
  ANY w WHERE  
    H(y, w)  
  THEN  
    y := F(y, w)  
  END
```

$$\begin{aligned} & I(x) \wedge J(x, y) \wedge H(y, w) \\ \Rightarrow & \\ & \exists v \cdot (G(x, v) \wedge J(E(x, v), F(y, w))) \end{aligned}$$

Correct Refinement Verification (3)

- Given a new event

```
EVENT new_e ≐  
  WHEN  
    H(y)  
  THEN  
    y := F(y)  
  END
```

and invariants $I(x)$ and $J(x, y)$, the statement to prove is :

$$I(x) \wedge J(x, y) \wedge H(y) \implies J(x, F(y))$$

Current Summary

- ## 9 Conclusion

```
WHEN
  P
  Q
THEN
  S
END
```

```
WHEN
  P
   $\neg Q$ 
THEN
  T
END
```

are merged into

```
WHEN
  P
THEN
  WHILE  Q  DO
    S
  END;
  T
END
```

Side Conditions :

- P must be invariant under S.
- The first event must have been introduced at one refinement step below the second one.
- Special Case : If P is missing the resulting "event" has no guard

```
WHEN
  P
  Q
THEN
  S
END
```

```
WHEN
  P
   $\neg Q$ 
THEN
  T
END
```

are merged into

```
WHEN
  P
THEN
  IF Q THEN S
  ELSE T
END;
```

Side Conditions :

- The disjunctive negation of the previous side conditions
- Special Case : If P is missing the resulting "event" has no guard

Applying the rule for the while

```
EVENT computing4 REFINES EVENT computing3
  WHEN
     $grd2 : cfac = n$ 
  THEN
     $act1 : resultat := vfac$ 
  END
```

```
EVENT event4 REFINES EVENT event3
  WHEN
     $grd1 : cfac \neq n$ 
  THEN
     $act1 : vfac := (cfac + 1) * vfac$ 
     $act2 : cfac := cfac + 1$ 
  END
END
```

```
EVENT computing4  EVENT event4
  WHILE  $cfac \neq n$  DO
     $act1 : vfac := (cfac + 1) * vfac$ 
     $act2 : cfac := cfac + 1$ 
  END;
END
```

Applying the INITIALISATION rule

```
EVENT INITIALISATION  
BEGIN  
  act1 : resultat : $\in$   $\mathbb{N}$   
  act3 : cfac := 0  
  act4 : vfac := 1  
END
```

```
init  
  resultat : $\in$   $\mathbb{N}$ ;  
  cfac := 0;  
  vfac := 1;
```

Deriving an algorithm

```
precondition    :  $n \in \mathbb{N}$ 
```

postcondition : $result = factorial(n)$

local variables : $vfac, cfac \in \mathbb{N}$

$$cfac := 0; vfac := 1; result \in \mathbb{N};$$
while $cfac \neq n$ **do**

Invariant : $vfac = fac(cfac)$

$$vfac := (cfac + 1) * vfac; cfac := cfac + 1;$$

•

```

result := vfac;

```

Current Summary

- ## 9 Conclusion

- Refinement helps in discovering invariants
- Refinement helps in proving invariants
- The choice of the *good* abstraction is not very simple and is a challenge by itself

Current Summary

- ## 9 Conclusion

The Iterative Pattern

CONTEXT $C0$

SETS

U

CONSTANTS

$x, v, d0, f, D$

AXIOMS

$axm1 : x \in \mathbb{N}$

$axm25 : D \subseteq U$

$axm24 : f \in D \rightarrow D$

$axm23 : d0 \in D$

$axm2 : v \in \mathbb{N} \rightarrow D$

$axm3 : v(0) = d0$

$axm4 : \forall n. n \in \mathbb{N} \Rightarrow v(n+1) = f(v(n))$

$th1 : Q(d0, d) \equiv (d = v(x))$

- the sequence v expresses the post-condition $Q(d_0, d)$ with the precondition $P(d_0)$.
- $Q(d_0, d)$ is equivalent to $d = v(x)$.
- The theorem $th1$ should be proved in the context $C0$. he

General PREPOST Machine

```

MACHINE PREPOST
SEES  $C_0$ 
VARIABLES
   $r$ 
INVARIANTS
   $inv1 : r \in D$ 
EVENTS
INITIALISATION
  BEGIN
     $act1 : r \in D$ 
  END
EVENT computing
  BEGIN
     $act1 : r := v(x)$ 
  END
END

```

- The theorem *th1* is validating the definition of the result *r* to compute.
- The event computing is expressing the *contract* of the given problem.
- it by a very simple problem that is the computation of the function n^2 using the addition operator.

First Refinement COMPUTING : Inductive Computation

```

EVENT INITIALISATION
BEGIN
  act1 :  $r \in D$ 
  act3 :  $vv := \{0 \mapsto d0\}$ 
  act5 :  $k := 0$ 
END

```

INITIALISATION is initializing the variables with respect to the initial values of the sequences of the context.

First Refinement COMPUTING : Inductive Computation

```

EVENT computing
  REFINES computing,
  WHEN
     $grd1 : x \in dom(vv)$ 
  THEN
     $act1 : r := vv(x)$ 
  END
END

```

computing is imply observing that the result is computed *simulating* the sequence vv .

First Refinement COMPUTING : Inductive Computation

```

EVENT step
  WHEN
     $grd1 : x \notin dom(vv)$ 
  THEN
     $act2 : vv(k+1) := f(vv(k))$ 
     $act4 : k := k + 1$ 
  END

```

step is *simulating* the computation of the values of the sequence vv as a model computation.

The Iterative Pattern

Completing the machines

- PREALGO : adding new variables for pointing out the necessary values to store cvv
- ALGO : hiding the model variables storing the unnecessary values of sequence vv
- ALGOPC ; adding control variable c

The Iterative Pattern

Listing 1 – Function derived from pattern for the sequence v

```
type (D)   f (int x)
{int      r , k , cv , or , ok , ocv ;
  r=0;k=0;cv=0;or=0;ok=k;ocv=cv ;
  while (k<x)
  {
      ok=k;ocv=cv ;
      k=ok+1;
      cv=f (ocv) ;
  }
  r=cv ; return ( r );}
```

Comments

- The produced algorithm can be now checked using another proof environment as for instance Frama-C.
- The inductive property of the invariant is clearly verified and is easily derived from the Event-B machines.
- The verification is not required, since the system is correct by construction but it is a checking of the process itself
- the project called ITERATIVE-PATTERN ;
- the project is the pattern itself
- The invariants of the Event-B models can be reused in the verification using Frama-C, for instance, and the verification of the resulting algorithm is a confirmation of the translation.

Listing 2 – Function derived from pattern power3

```
#include <limits.h>
/*@ requires 0 <= x;
    requires x*x*x <= INT_MAX ;
    ensures \result == x*x*x;
*/
int power3(int x)
{
    int r, ocz, cz, cv, cu, ocv, cw, ocw, ct, oct, ocu, k, ok;
    cz=0; cv=0; cw=1; ct=3; cu=0; ocw=cw; ocz=cz;
    oct=ct; ocv=cv; ocu=cu; k=0; ok=k;
    /*@ loop invariant cz == k*k*k;
        @ loop invariant cu == k;
        @ loop invariant cv+ct==3*(cu+1)*(cu+1);
        @ loop invariant cz+cv+cw==3*(cu+1)*(cu+1)*(cu+1);
        @ loop invariant cv== 3*cu*cu;
        @ loop invariant cw == 3*cu+1;
        @ loop invariant k <= x;
        @ loop assigns ct, oct, cu, ocu, cz, ocz, k, cv, cw, r, ok;
        @ loop assigns ocv, ocw; */
    while (k<x)
    {
        ocz=cz; ok=k; ocv=cv; ocw=cw; oct=ct; ocu=cu;
        cz=ocz+ocz+ocz;
        cv=ocv+oct;
        ct=oct+6;
        cw=ocw+3;
        cu=ocu+1;
        k=ok+1;
    }
    r=cz; return (r);
}
```

Translation of Event-B Models

Summary for proof obligations

Name	Total	Automatic	Interactive
ex-induction	40	36	4
C0	2	0	2
PREPOST	4	4	0
COMPUTING	16	14	2
PREALGO	9	9	0
ALGO	6	6	0
ALGOPC	3	3	0

Summary

- The loop invariant is inductive but Frama-C does not prove it completely.
- Not the case with the RODIN platform which is able to discharge the whole set of proof obligations.
- However, the Event-B model is using auxiliary knowledge over sequences used for defining the computing process.
- The most difficult theorem is to prove that $\forall n \in \mathbb{N} : z_n = n * n * n$.

The Iterative Pattern

Current Summary

- ## 9 Conclusion

- Refinement helps in discovering invariants
- Refinement helps in proving invariants
- The choice of the *good* abstraction is not very simple and is a challenge by itself
- Patterns may help in applying refinement in a systematic way
- Summary on proof obligations
