## Listing 1 – Bug bug0

```
#include <stdio.h>
#include <stdlib.h>
#include <time.h>

int main() {
    int x, y;
    // Seed the random number generator with the current time
    srand(time(NULL));
    // Generate a random number between 1 and 100
    x = rand() % 100 + 1;
    // Perform some calculations
    y = x / (100 - x);
    printf("Result: %d\n", y);
    return 0;
}
```

## Listing 2 – Bug bug00

```
// Heisenbug
#include <stdio.h>
#include <stdlib.h>
#include <time.h>

int main() {
    int x, y, i=0;

    for (i = 0; i <= 100000; i++) {
        // Seed the random number generator with the current time
        srand(time(NULL));

        // Generate a random number between 1 and 100
        x = rand() % 100 + 1;
        printf("Result: x=%d\n", x);
        // Perform some calculations
        y = x / (100 - x);

        printf("Result: i=%d x=%d y=%d\n", i, x, y);
    }

    return 0;
}
```

## Listing 3 – Bug bug000

```
// Heisenbug
#include <stdio.h>
#include <stdlib.h>
#include <time.h>

int main() {
    int x, y, i=0;

    for (i = 0; i <= 100; i++) {
        // Seed the random number generator with the current time
        srand(time(NULL)+i);

        // Generate a random number between 1 and 100
        x = rand() % 100 + 1;
        printf("Result: x=%d\n", x);
        // Perform some calculations
        y = x / (100 - x);

        printf("Result: i=%d x=%d y=%d\n", i, x, y);
    }

    return 0;
}
```

## Listing 4 – Bug bug1

```
#include <stdio.h>

int main() {
    int numbers[5] = {1, 2, 3, 4, 5};
    int sum = 0;

    // Attempt to calculate the sum of numbers in the array
    for (int i = 0; i <= 5; i++) {
        sum += numbers[i];
    }

    printf("Sum: %d\n", sum);
    sum = numbers[7];
    printf("Sum: %d\n", sum);

    return 0;
}
```

## Listing 5 – Bug bug2

```
#include <stdio.h>

int main() {
    int x = 5;
    int y = 3;

    // Bug 1: Incorrect variable in the printf statement
    printf("The_value_of_x_is:%d\n", y);

    // Bug 2: Infinite loop
    while (x > 0) {
        printf("x_is_greater_than_0\n");
    }

    return 0;
}
```

## Listing 6 – Bug bug3

```
#include <stdio.h>

void binarySort(int arr[], int n) {
    for (int i = 0; i < n - 1; i++) {
        int minIndex = i;

        for (int j = i + 1; j < n; j++) {
            if (arr[j] < arr[minIndex]) {
                minIndex = j;
            }
        }

        // Bug: Swapping elements
        int temp = arr[i];
        /*@ assert temp == arr[i]; */
        arr[i] = arr[minIndex];
        /*@ assert temp == arr[i] && arr[i] == arr[minIndex]; */
        arr[i] = temp;
        /*@ assert temp == arr[i] && arr[i] == arr[minIndex]; */
    }
}

int main() {
    int arr[] = {4, 2, 7, 1, 9, 3};
    int n = sizeof(arr) / sizeof(arr[0]);

    printf("Unsorted_Array:\n");
    for (int i = 0; i < n; i++) {
        printf("%d_", arr[i]);
    }

    binarySort(arr, n);

    printf("\nSorted_Array:\n");
    for (int i = 0; i < n; i++) {
        printf("%d_", arr[i]);
    }
}
```

## Listing 7 – Bug bug4

```
#include <stdio.h>

int linearSearch(int arr[], int n, int target) {
    for (int i = 0; i < n; i++) {
        if (arr[i] == target) {
            return i;
        }
    }
    return -1;
}

int main() {
    int arr[] = {2, 4, 7, 1, 9, 3};
    int n = sizeof(arr) / sizeof(arr[0]);

    int target = 7;

    int result = linearSearch(arr, n, target);

    if (result != -1) {
        printf("Element_%d_found_at_index_%d\n", target, result);
    } else {
        printf("Element_%d_not_found_in_the_array\n", target);
    }

    return 0;
}
```

## Listing 8 – Bug bug5

```
#include <stdio.h>

int binarySearch(int arr[], int n, int target) {
    int left = 0;
    int right = n - 1;

    while (left <= right) {
        int mid = (left + right) / 2;

        // Bug 1: Incorrect comparison
        if (arr[mid] = target) { // Should be '==' for comparison, not '='
            return mid;
        } else if (arr[mid] < target) {
            left = mid + 1; // Bug 2: Update 'left' incorrectly
        } else {
            // Bug 3: Missing update for 'right' in the else case
        }
    }

    return -1;
}

int main() {
    int arr[] = {1, 2, 3, 4, 5, 5, 6, 7, 8, 9, 78};
    int n = sizeof(arr) / sizeof(arr[0]);

    int target = 10;

    int result = binarySearch(arr, n, target);

    if (result != -1) {
        printf("Element_%d_found_at_index_%d\n", target, result);
    } else {
        printf("Element_%d_not_found_in_the_array\n", target);
    }
}
```

## Listing 9 – Bug bug6

```
#include <stdio.h>
#include <limits.h>

int divide(int a, int b) {
    if (b != 0) {
        return a / b; // Bug: Does not handle overflow
    } else {
        return 0;
    }
}

int main() {
    int x = INT_MIN;
    int y = -1;
    int result = divide(x, y);

    printf("Result: %d\n", result);

    return 0;
}
```

### Listing 10 – Function average

```
#include <stdio.h>
#include <limits.h>
int average(int a,int b)
{
    return ((a+b)/2);
}

int main()
{
    int x,y;
    x=INT_MAX;y=INT_MAX;
    printf(" Average for %d and %d is %d\n",x,y,
        average(x,y));
    return 0;
}
```

Execution produces a result

Average for 2147483647 and 2147483647 is -1

### Execution produces a result

Average for 2147483647 and 2147483647 is -1

### Using frama-c produces a required annotation

```
int average(int a, int b)
{
    int __retres;
    /*@ assert rte: signed_overflow: -2147483648 <= a + b; */
    /*@ assert rte: signed_overflow: a + b <= 2147483647; */
    __retres = (a + b) / 2;
    return __retres;
}
```

### Listing 11 – Function average.....

```
#include <stdio.h>
#include <limits.h>
/*@ requires 0 <= a;
    requires a <= INT_MAX ;
    requires 0 <= b;
    requires b <= INT_MAX ;
    requires 0 <= a+b;
    requires a+b <= INT_MAX ;
    ensures \result <= INT_MAX;
*/
int average(int a,int b)
{
    return((a+b)/2);
}

int main()
{
    int x,y;
    x=INT_MAX / 2;y=INT_MAX / 2;
    // printf("Average for %d and %d is %d\n",x,y,
    //      );
    return average(x,y);
}
```

▶ NG velocity system :

- **Hardware :**

- ▶ *Electro-mechanical sensor* : detects rotations
- ▶ *Two 16-bit counters* : Rotation counter, Milliseconds counter
- ▶ *Interrupt service routine* : updates rotation counter and stores current time.

- **Software :**

- ▶ *Real-time operating system* : invokes update function every 500 ms
- ▶ *16-bit global variable* : for recording rotation counter update time
- ▶ *An update function* : estimates ground velocity of the aircraft.

▶ Input data available to the system :

- *time* : in milliseconds
- *distance* : in inches
- *rotation angle* : in degrees

▶ Specified system performs velocity estimations in *imperial* unit system

▶ **Note** : expressed functional requirement is in *SI* unit system (km/hr).

### What are the main properties to consider for formalization ?

- ▶ Two different types of data :
  - counters with modulo semantics
  - non-negative values for time, distance, and velocity
- ▶ Two dimensions : *distance* and *time*
- ▶ Many units : distance (inches, kilometers, miles), time (milliseconds, hours), velocity (kph, mph)
- ▶ And interaction among components

### How should we model ?

- ▶ Designer needs to consider units and conversions between them to manipulate the model
- ▶ One approach : Model units as *sets*, and conversions as constructed types – *projections*.
- ▶ Example :
  - 1  $estimateVelocity \in \text{MILES} \times \text{HOURS} \rightarrow \text{MPH}$
  - 2  $mphTokph \in \text{MPH} \rightarrow \text{KPH}$

## Sample Velocity Estimation

WHEEL\_DIAMETER = 22 inches  
PI = 3.14

12 inches/foot  
5280 feet/mile

estimatedGroundVelocity = distance travel/elapsed time  
=  $((3.14 * 22) / (12 * 5280)) / ((4367 - 4123) / (1000 * 3600))$   
= 16 mph

### Safety Property

- ▶ Storing the number of *NGClick* in a *n*-bit variable *VNGClick*
- ▶ Integers are denoted by the set *Int* and is simply defined by the interval  $Int \hat{=} INT\_MIN..INT\_MAX$ .
- ▶ Safety requirement :  
*The value of VNGClick is always in the range of implementation Int or equivalently  $VNGClick \in Int$*
- ▶  $Length = \pi \cdot diameter \cdot VNGClick$  (mathematical property)
- ▶  $Length \leq 6000$  (domain property)
- ▶  $\pi \cdot diameter \cdot VNGClick \leq 6000$
- ▶  $VNGClick \leq 6000 / (\pi \cdot diameter)$
- ▶ if  $n=8$ , then  $2^7 - 1 = 127$  and  
 $6000 / (\pi \cdot [22, inch]) = 6000 / (\pi \cdot 55, 88) = 6000 / (3, 24 \cdot [55, 88, cm]) = 6000 / (3, 24 \cdot 0.5588) \approx 3419$  and the condition of safety can not be satisfied in any situation.
- ▶ if  $n=16$ , then  $2^{15} - 1 = 65535$  and  $6000 / (\pi \cdot [22, inch]) \approx 3419$  and the condition of safety can be satisfied in any situation since

### Safety Property

- ▶ Storing the number of `NGClick` in a `n`-bit variable `VNGClick`
- ▶ Integers are denoted by the set *Int* and is simply defined by the interval  $Int \hat{=} INT\_MIN..INT\_MAX$ .
- ▶ Safety requirement :  
*The value of `VNGClick` is always in the range of implementation *Int* or equivalently  $VNGClick \in Int$*

$$RTE\_VNGClick : 0 \leq vNGClick \leq INT\_MAX \quad (1)$$

- ▶ The current value of `VNGClick` is always bounded by the two values 0 and `INT_MAX`.

### Computing the date of easter

Easter is the Sunday following the first full moon of spring, that is, according to the definition established by the Council of Nicea in 325 :  
"Easter is the Sunday following the 14th day of the Moon which reaches that age on or immediately after March 21."

According to this definition, Easter falls between March 22 and April 25 of each year.

- ▶ Easter date 2019 : 20 march / 21 avril
- ▶ Easter date 2020 : 7 april / 12 april
- ▶ Easter date 2021 : 28 march / 4 april
- ▶ Easter date 2022 : 16 april / 17 april 2022
- ▶ Easter date 2023 : 6 april / 9 april 2023
- ▶ Easter date 2024 : 25 march / 31 march 2024
- ▶ Easter date 2025 : 12 april / 20 april 2025
- ▶ Easter date 2026 : 2 april / 5 april 2026

- ▶ The year is given as a number year
- ▶ The date of Easter is computed as a date day and month

### General Protocol for Computing the Date of Easter

- ▶ Easter is a Sunday.
- ▶ Date of the spring full moon `full-moon-day` and `full-moon-month` from the 21st of March.
- ▶ `full-moon-month` is either 3 or 4.
- ▶ The earliest date is March 22nd
- ▶ Determine the First Sunday just after the spring full moon

### Listing 12 – Using C function for date of Easter

```
*****
* year * day * month *
*****
* 2019 * 21 * April *
*****
* 2020 * 12 * April *
*****
* 2021 * 4 * April *
*****
* 2022 * 17 * April *
*****
* 2023 * 9 * April *
*****
* 2024 * 31 * March *
*****
* 2025 * 20 * April *
*****
* 2026 * 5 * April *
*****
*****
```

- ▶ The day of Spring namely March 21 :  $dspring = (21, 3)$  (**domain property**)
- ▶ The table of Full Moon of the current year :  $tfullmoon[NFM]$  (**domain property**)
- ▶ Computing the date of the first full moon of Spring :  
 $dfullmoon = tfullmoon[i]$  where  $i \in 0..NFM-1$  (**algorithmic property**)
- ▶ Computing the date of the next Sunday starting from  
 $nextday(dfullmoon)$  (**algorithmic property**)

### Tryptich $\mathcal{D}, \mathcal{A}$ sat $\mathcal{R}$

- ▶  $\mathcal{D}$  (domain of problem) contains informations on Moon Phases.
- ▶  $\mathcal{R}$  (requirements or prescription) expresses the day of Easter following the rule.
- ▶  $\mathcal{A}$  (algorithm or program or protocol) contains the different algorithms used for computing necessary informations.

- ▶ Verification : techniques and tools applied to check the *internal* relationship between the three components  $\mathcal{D}, \mathcal{A}, \mathcal{R}$
- ▶ Validation : techniques and tools applied to check the *external* relationship between the three components  $\mathcal{D}, \mathcal{A}, \mathcal{R}$  and external entities.

### Computing the number of days for waiting a given future date ?

You may want to get the number of days between the current day and a future day :

- ▶ Number of days until Christmas
- ▶ Number of days until Retirement
- ▶ Notification of an event three days before a given date.
- ▶ ...

## What is the next day of a given date ?

- ▶ Domain Properties related to dates and calendars :
  - A year is made up of 12 months
  - There are two kinds of months 30 days and 31 days but one month has 28 days and 29 days when the year is a leapyear.
- ▶ Mathematical definition of a leapyear

### Listing 13 – pre/post specification for leapyear(int year)

```
#ifndef _LEAP_H
/*@ requires  -5000 <= year;
   @ ensures year % 400 == 0 ==> \result == 1;
   @ ensures year % 400 != 0 && year % 100 != 0 && year % 4 == 0 ==> \result == 1;
   @ ensures year % 400 != 0 && year % 100 != 0 && year % 4 != 0 ==> \result == 0;
   @ ensures \result == 1 ==> (year % 400 == 0) || (year % 400 != 0 && year % 100 != 0 && year % 4 == 0);
   @ ensures \result == 0 ==> (year % 400 != 0) && (year % 400 == 0 || year % 100 == 0 || year % 4 != 0);
*/
int leapyear(int year);
#endif
```

## Defining leapyear(int year)

### Listing 14 – Using C function for date of Easter

```
#include "leapyear.h"

int leapyear(int year)
{
    int r=0; // = 0;
    // leap year if perfectly divisible by 400
    if (year % 400 == 0) {
        r = 1; // printf("%d is a leap year.", year);
    }
    // not a leap year if divisible by 100
    // but not divisible by 400
    else if (year % 100 == 0) {
        r=0; // printf("%d is not a leap year.", year);
    }
    // leap year if not divisible by 100
    // but divisible by 4
    else if (year % 4 == 0) {
        r=1; // printf("%d is a leap year.", year);
    }
    // all other years are not leap years
    else {
        r=0; // printf("%d is not a leap year.", year);
    };

    return r;
}
```

## Computing a sequence of dates

- ▶ Computing the number of days from fromdate till todate is following a sequence :

$$d_0 = \text{fromdate} \xrightarrow{\text{nextday}} d_1 \xrightarrow{\text{nextday}} d_2 \dots \xrightarrow{\text{nextday}} d_{n-1} \xrightarrow{\text{nextday}} d_n = \text{todate}$$

- ▶ The value of  $n$  is not known and is in fact the number we want to compute.
- ▶ Define a function `nextday` which is returning the next day of a given day.
- ▶ A date is a triple as  $(d,m,y)$  and is satisfying the function :

Listing 15 – `checkdate(struct date now)`

```
#include "structure.h"
#include "leapyear.h"
struct date;
#include "checkdate.h"

int checkdate(struct date now)
{
    int r=0;
    int day=now.day, month=now.month, year=now.year, aleapday;
    int aleapyear=leapyear(year);
    if ( month == 12 || month == 1 || month == 3 || month == 5 || month == 7 || month == 8 || month
        if ( 1 <= day && day <= 31) {r=1;};
    } else if (month == 4 || month == 6 || month == 9 || month == 11) {
        if ( 1 <= day && day <= 30) {r=1;};
    } else if ( aleapyear==1 && month == 2 ) {

# Critical System

Critical systems are systems in which defects could have a dramatic impact on human life or the environment.

### Critical System

Critical systems are systems in which defects could have a dramatic impact on human life or the environment.

### System failure

Software failure or fault of complex systems is the major cause in the software crisis. For example,

- ▶ **Therac-25 (1985-1987)** : six people overexposed through radiation.
- ▶ **Cardiac Pacemaker (1990-2002)** : 8834 pacemakers were explanted.
- ▶ **Insulin Infusion Pump (IIP) (2010)** : 5000 adverse events.

- ▶ Safety-critical systems : A system whose failure may result in injury, loss of life or serious environmental damage. **An example of a safety-critical system is a control system for a chemical manufacturing plant.**
- ▶ Mission-critical systems : A system whose failure may result in the failure of some goal-directed activity. **An example of a mission-critical system is a navigational system for a spacecraft.**
- ▶ Business-critical systems : A system whose failure may result in very high costs for the business using that system. **An example of a business-critical system is the customer accounting system in a bank.**

### Issue

The high costs of failure of critical systems means that trusted methods and techniques must be used for development.

- ▶ Legacy systems are socio-technical computer-based systems that have been developed in the past, often using older or obsolete technology.
- ▶ Legacy systems include not only hardware and software but also legacy processes and procedures ;old ways of doing things that are difficult to change because they rely on legacy software. Changes to one part of the system inevitably involve changes to other components.
- ▶ Legacy systems are often business-critical systems. They are maintained because it is too risky to replace them.
- ▶ For example, for most banks the customer accounting system was one of their earliest systems.

### Software Process

A software process is a structured set of activities required to develop a software system : Spiral Model, Waterfall Model, V-Shaped Model, etc.

A software process involve the following steps :

- ▶ Specification *defining what the system should do ;*
- ▶ Design and implementation *defining the organization of the system and implementing the system ;*
- ▶ Validation *checking that it does what the customer wants ;*
- ▶ Evolution *changing the system in response to changing customer needs.*

### software process model

A software process model is an abstract representation of a process. It presents a description of a process from some particular perspective.

- ▶ The waterfall model : Plan-driven model ; Separate and distinct phases of specification and development.
- ▶ Incremental development : Specification, development and validation are interleaved ; plan-driven or agile.
- ▶ Reuse-oriented software engineering : The system is assembled from existing components ; plan-driven or agile.

# The Waterfall Model

(from Software Engineering by Ian Sommerville)

# Boehm's spiral model of the software process

(from Software Engineering by Ian Sommerville)

\_\_\_\_\_

(from Software Engineering by Ian Sommerville)

## Requirement Engineering

The process of establishing what services are required and the constraints on the system's operation and development.

- ▶ Feasibility study : Is it technically and financially feasible to build the system ?
- ▶ Requirements elicitation and analysis : What do the system stakeholders require or expect from the system ?
- ▶ Requirements specification : Defining the requirements in detail
- ▶ Requirements validation : Checking the validity of the requirements

# General Model of the Design Process

(from Software Engineering by Ian Sommerville)

## Testing phases in a plan-driven software process

(from Software Engineering by Ian Sommerville)

### SIL

Safety integrity level (SIL) is defined as a relative level of risk-reduction provided by a safety function, or to specify a target level of risk reduction. In simple terms, SIL is a measurement of performance required for a safety instrumented function (SIF).

- ▶ The European functional safety standards based on the IEC 61508 standard defines four SILs (with SIL 4 the most dependable and SIL 1 the least).
- ▶ A SIL is determined based on a number of quantitative factors in combination with qualitative factors such as development process and safety life cycle management.

- ▶ Probability of Failure on Demand during 10 years.
- ▶ SILs :
  - SIL4 : Conséquence très importante sur la communauté entraînant une réduction du danger de 10 000 à 100 000.
  - SIL3 : Conséquence très importante sur la communauté et les employés entraînant une réduction du danger de 1 000 à 10 000.
  - SIL2 : Protection importante de l'installation, de la production et des employés entraînant une réduction du danger de 100 à 1000.
  - SIL1 : Faible protection de l'installation, de la production entraînant une réduction du danger de 10 à 100.

*Grâce à une grande maîtrise en calcul formel, en sécurité de fonctionnement et à l'utilisation de la méthode B (beaucoup utilisée en milieu industriel pour réaliser des logiciels sécuritaires prouvés), ClearSy System Engineering est qualifiée pour mener à bien des projets nécessitant un contexte de certification de niveau SIL 2, SIL 3, ou SIL 4, selon la norme 61508.*

- ⑨ Topics of course

- ▶ Validation : *Are we building the right product*
- ▶ Verification : *Are we building the process right ?*

### verification

The verification aims to check that the software meets its stated functional and non-functional requirements.

- ▶ *functional requirements*
- ▶ *non-functional requirements*

### validation

The verification aims to ensure that the software meets the customer's expectations.

# Decidability or Undecidability

---

- A problem  $x \in P$  is generally stated by the function  $\chi_{x \in P}$  where  $\chi_{x \in P}(u) = 1$ , if  $P(u)$  is true and  $\chi_{x \in P}(u) = 0$ , if  $P(u)$  is false :
- Problem 1 :  $x \in 0..n$  where  $n \in \mathbb{N}$
  - Problem 1 :  $w \in \mathcal{L}(G)$  where  $G$  is a grammar over the finite set of alphabet symbols  $\Sigma$  and  $\mathcal{L}(G) \subseteq \Sigma^*$ .

- ▶ A problem  $x \in P$  is generally stated by the function  $\chi_{x \in P}$  where  $\chi_{x \in P}(u) = 1$ , if  $P(u)$  is true and  $\chi_{x \in P}(u) = 0$ , if  $P(u)$  is false :
  - Problem 1 :  $x \in 0..n$  where  $n \in \mathbb{N}$
  - Problem 1 :  $w \in \mathcal{L}(G)$  where  $G$  is a grammar over the finite set of alphabet symbols  $\Sigma$  and  $\mathcal{L}(G) \subseteq \Sigma^*$ .
- ▶ A problem  $x \in P$  is decidable, when the function  $\chi_{x \in P}$  is computable or more precisely the function can be computed by a program

- ▶ A problem  $x \in P$  is generally stated by the function  $\chi_{x \in P}$  where  $\chi_{x \in P}(u) = 1$ , if  $P(u)$  is true and  $\chi_{x \in P}(u) = 0$ , if  $P(u)$  is false :
  - Problem 1 :  $x \in 0..n$  where  $n \in \mathbb{N}$
  - Problem 1 :  $w \in \mathcal{L}(G)$  where  $G$  is a grammar over the finite set of alphabet symbols  $\Sigma$  and  $\mathcal{L}(G) \subseteq \Sigma^*$ .
- ▶ A problem  $x \in P$  is decidable, when the function  $\chi_{x \in P}$  is computable or more precisely the function can be computed by a program
- ▶ Problem of the correctness of a program :
  - Assume that  $\mathcal{F}$  is the set of unary function over natural numbers :  $\mathcal{F} = \mathbb{N} \rightarrow \mathbb{N}$ .
  - $\mathcal{C} \subseteq \mathcal{F}$  : the set of computable (or programmable) functions is  $\mathcal{C}$
  - $f \in \mathcal{C} = \{\Phi_0, \Phi_1, \dots, \Phi_n, \dots\}$  : the set of computable functions is denumerable.
  - The problem  $x \in \text{dom}(\Phi_y)$  is not decidable and it expresses the correctness of programs.

B

### Implicite versus explicite

- ▶ Ecrire  $101 = 5$  peut avoir une signification

### Implicite versus explicite

- ▶ Ecrire  $101 = 5$  peut avoir une signification
- ▶ Le code du nombre  $n$  est  $101$  à gauche du symbole  $=$  et le code du nombre  $n$  est sa représentation en base 10 à droite.
- ▶  $n_{10} = 5$  et  $n_2 = 101$
- ▶ Vérification :  $base(2, 10, 101) = 1.2^2 + 0.2 + 1.2^0 = 5_{10}$

## Example : description of static behaviour

---

- ▶ A train moving at absolute speed  $spd1$
- ▶ A person walking in this train with relative speed  $spd2$ 
  - One may compute the absolute speed of the person
- ▶ Modelling
  - Syntax. Classical expressions
    - ▶ Type  $Speed = Float$
    - ▶  $spd1, spd2 : Speed$
    - ▶  $AbsoluteSpeed = spd1 + spd2$
  - Semantics
    - ▶ If  $spd1 = 25.6$  and  $spd2 = 24.4$  then  $AbsoluteSpeed = 50.0$
    - ▶ If  $spd1 = "val"$  and  $spd2 = 24.4$  then exception raised
  - Pragmatics
    - ▶ What if  $spd1$  is given in *mph* (miles per hour) and  $spd2$  in *km/s* (kilometers per second) ?
    - ▶ What if  $spd1$  is a relative speed ?

## Method for verifying program properties

correctness and Run Time Errors

A program  $P$  *satisfies* a (pre,post) contract :

- ▶  $P$  transforms a variable  $x$  from initial values  $x_0$  and produces a final value  $x_f : x_0 \xrightarrow{P} x_f$
- ▶  $x_0$  satisfies pre :  $\text{pre}(x_0)$  and  $x_f$  satisfies post :  $\text{post}(x_0, x_f)$
- ▶  $\text{pre}(x_0) \wedge x_0 \xrightarrow{P} x_f \Rightarrow \text{post}(x_0, x_f)$
- ▶  $\mathbb{D}$  est le domaine RTE de  $X$

requires  $\text{pre}(x_0)$

ensures  $\text{post}(x_0, x_f)$

variables  $X$

begin

$0 : P_0(x_0, x)$

instruction<sub>0</sub>

...

$i : P_i(x_0, x)$

...

instruction <sub>$f-1$</sub>

$f : P_f(x_0, x)$

end

▶  $\text{pre}(x_0) \wedge x = x_0 \Rightarrow P_0(x_0, x)$

▶  $\text{pre}(x_0) \wedge P_f(x_0, x) \Rightarrow \text{post}(x_0, x)$

▶ For any pair of labels  $\ell, \ell'$   
such that  $\ell \longrightarrow \ell'$ , one verifies that,  
pour any values  $x, x' \in \text{MEMORY}$   
$$\left( \begin{array}{l} \text{pre}(x_0) \wedge P_\ell(x_0, x) \\ \wedge \text{cond}_{\ell, \ell'}(x) \wedge x' = f_{\ell, \ell'}(x) \end{array} \right) \Rightarrow P_{\ell'}(x_0, x')$$

▶ For any pair of labels  $m, n$   
such taht  $m \longrightarrow n$ , one verifies that,  
 $\forall x, x' \in \text{MEMORY} : \text{pre}(x_0) \wedge$   
 $P_m(x_0, x) \Rightarrow \text{DOM}(m, n)(x)$

### DO-178C

DO-178C recognizes that to ensure correctness, control and confidence in software, functional safety must be addressed systematically throughout the software development life cycle.

### DO-333/ED-218

DO-333 is called “Formal Methods Supplement to DO-178C and DO-278A”. It is supplementary to DO-178C and DO-278A, and identifies additional objectives that apply when using formal methods as part of a software life cycle. It also provides advice on how the objectives in DO-178C should be approached w
