# Tutorial Modelling Software-based Systems

. . .

Tutorial 1 : Specifying a problem using the Eevent-B modelling language Dominique Méry  $28 \; \mathrm{mars} \; 2025$ 

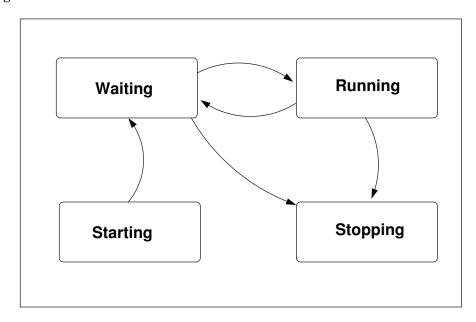

### Exercice 1 ex1-tut1.zip

Express the following states machine using an Event B machines and check properties on the resulting models.

### Exercice 2 ex2-tut1.zip

Express the following states machine using an Event B machines and check properties on the resulting models.

## Exercice 3 ex4-tut1.zip

We consider a finite sequence of integers  $v_1, \ldots, v_n$  where n is the length of the sequence and is supposed to be fixed. Write an Event B specification modelling the computation of the value

of the summation of the sequence v. You should define cerafully v, n and the summation of a finite sequence of integers.

#### Exercice 4 ex5-tut1.zip

Express the following property in Event B:

We assume to have p resources which may be shared by n processes. If a process uses a given resource, the resource can not be used by another process. A process can use only at most one resource.

### Exercice 5 ex6-tut1.zip

A Petri net is a uple R=(S,T,F,K,M,W)

- S is a finite set of places.
- T is a finite set of transitions.
- $-S \cap T = \emptyset$
- F is the flow relation :  $F \subseteq S \times T \cup T \times S$
- K is expressing the capacity of each place :
  - $K \in S \rightarrow Nat \cup \{\omega\}$
- *M* is reprenting the initial marking of each place :
  - $M \in S \rightarrow Nat \cup \{\omega\}$  and satisfies the following condition  $\forall s \in S : M(s) \leq K(s)$ .
- W is the weight of each edge:
  - $W \in F 
    ightarrow Nat \cup \{\omega\}$

THe state of a Petri net R is defined by a set of markings:

- a marking M for R is a function from S to Nat  $\cup \{\omega\}$ :
  - $M \in S \rightarrow Nat \cup \{\omega\}$  and it satisfies the condition  $\forall s \in S : M(s) \leq K(s)$ .
- a transition t of T is ready to fire for a marking M of R, if
  - 1.  $\forall s \in \{s' \in S \mid (s',t) \in F\}$ :
    - $M(s) \geq W(s,t)$ .
  - 2.  $\forall s \in \{ s' \in S \mid (t,s') \in F \}$ :

$$M(s) < K(s) - W(s,t)$$
.

 $-t \in T : Pre(t) = \{s' \in S : (s',t) \in F\} \text{ and } Post(t) = \{s' \in S : (t,s') \in F\}$ 

The simulation of a Petri net is defined by a relation linking three elements: a marking M, a marking M' and a transition t as follows:

— the new marking M' is defined as follows from M:

```
M'(s) = \begin{cases} M(s) - W(s,T), \text{ si } s \in PRE(T) - POST(T) \\ M(s) + W(T,S), \text{ si } s \in POST(T) - PRE(T) \\ M(s) - W(s,T) + W(T,S), \text{ si } s \in PRE(T) \cap POST(T) \\ M(s), \text{ sinon} \end{cases}
```

We consider the following Petri net:

**Question 5.1** Translate this Petri net in Event B.

**Question 5.2** Express safety properties that you can discover from the diagram.

**Exercice 6** (*ex7-tut1.zip*)

We consider the following abstract machine/

```
MACHINE M1
VARIABLES
INVARIANTS
EVENTS
EVENT INITIALISATION
 BEGIN
 act1: x := -10
 END
 EVENT evt1
 WHEN
 grd1: x \ge -1
 THEN
 act1:x:=x{+}1
 END
 EVENT evt2
 WHEN
 grd1: x \leq -1
 grd2: x \geq -44
 THEN
 act1: x := x-1
 END
END
```

We have possible candidates as invariant. For each question, explain why the assertion is or is not an inductive invariant. For each question, explain why the assertion is or is not a safety property.

## **Question 6.1** (*M1*)

 $inv1: x \in \mathbb{Z}$   $inv3: x \le -1$ 

## **Question 6.2** (*M2*)

 $\begin{array}{l} inv1: x \in \mathbb{Z} \\ inv3: x \leq -3 \end{array}$ 

### Question 6.3 (M3)

 $inv1: x \in \mathbb{Z}$   $inv4: -45 \le x \land x \le -10$ 

## **Question 6.4** (*M4*)

 $inv1: x \in \mathbb{Z}$   $inv3: x \le -3$   $inv4: -45 \le x \land x \le -10$  $inv2: x \le -1$ 

#### Exercice 7 ex8-tut1.zip

A semaphore s is a shared variable accessible by two operations : P(s) and V(s). Informally, we can describe the effect of these two operations as follows :

- P(s) is testing if the value of s is greater than 0 and is not equal to 0. Il the value of s is 0, the process which is executing P(s) is inserted in a queue.
- V(s) is increasing the value of s by one, if the queue is non empty. If the queue is non empty, the first waiting process of the queue is awaken and becomes a lively process. Using the Event B modelling features, describe a system using the primitives.
