```
#include <stdio.h>
#include < stdlib . h>
#include <time.h>
int main() {
    int x, y;
    // Seed the random number generator with the current time
    srand(time(NULL));
    // Generate a random number between 1 and 100
    x = rand() \% 100 + 1;
    // Perform some calculations
    y = x / (100 - x);
    printf("Result:-%d\n", y);
    return 0;
```

```
int main(void)
  int __retres;
  int x:
  int v;
  time_t tmp;
  int tmp_0;
  tmp = time((time_t *)0);
  srand((unsigned int)tmp);
  { /* sequence */
   tmp_0 = rand();
    /*@ assert rte: signed_overflow: (int)(tmp_0 % 100) + 1 <= 214
    x = tmp_0 \% 100 + 1;
  /*@ assert rte: signed_overflow: 100 - x \le 2147483647; */
  /*@ assert rte: division_by_zero: (int)(100 - x) /= 0; */
  /*@ assert rte: signed_overflow: x / (int)(100 - x) \le 21474836
  y = x / (100 - x);
  printf("Result:-%d\n",y); /* printf_va_1 */
  _{-}retres = 0;
  return __retres;
```

RTE with frama-c

```
// Heisenbug
#include <stdio.h>
#include <stdlib.h>
#include <time.h>
int main() {
  int x, y, i=0;
    for (i = 0; i \le 100000; i++) {
    // Seed the random number generator with the current time
    srand(time(NULL));
    // Generate a random number between 1 and 100
    x = rand() \% 100 + 1;
         printf("Result:-x=-%d n'',x);
    // Perform some calculations
    y = x / (100 - x);
    printf("Result: -i=\%d--\%d \setminus n", i, y);
    return 0;
```

RTE with frama-c but a modification

```
// Heisenbug
#include <stdio.h>
#include <stdlib.h>
#include <time.h>
int main() {
  int x, y, i=0;
    for (i = 0; i \le 100; i++) {
    // Seed the random number generator with the current time
    srand(time(NULL)+i);
    // Generate a random number between 1 and 100
    x = rand() \% 100 + 1;
         printf("Result:-x=-%d n'',x);
    // Perform some calculations
    y = x / (100 - x);
    printf("Result: -i=\%d--\%d \setminus n", i, y);
    return 0;
```

Implicit and explicit in formal modelling

Our aim is to analyze what is implicit and what is explicit in formal modelling...

- Semantics in modelling :
 - Semantics expressed by a theory (e.g. Event-B) used to formalize hardware and/or software systems
 - Same theory is used for wide variety of heterogeneous systems
- Semantics in domain
 - ► Environment within which system evolve : application domain/context
 - Information provided by domain is often associated while in operation
 - Either assumed and omitted while formalising systems or hardcoded in formal models
 - Same context is used for wide variety of heterogeneous systems

A case study for studying these properties

Nose Gear Velocity

Estimated ground velocity of the aircraft should be available only if
it is within 3 km/hr of the true velocity at some moment within

Characterization of a System (I)

- NG velocity system :
 - Hardware :
 - Electro-mechanical sensor : detects rotations
 - Two 16-bit counters: Rotation counter, Milliseconds counter
 - Interrupt service routine : updates rotation counter and stores current time.
 - Software :
 - · Real-time operating system: invokes update function every 500 ms
 - 16-bit global variable: for recording rotation counter update time
 - An update function : estimates ground velocity of the aircraft.
- Input data available to the system :
 - time: in milliseconds
 distance: in inches
 - distance . III inches
 - rotation angle : in degrees
- Specified system performs velocity estimations in imperial unit system
- Note: expressed functional requirement is in SI unit system (km/hr).

Characterization of a System (II) cont.

What are the main properties to consider for formalization?

- Two different types of data :
 - counters with modulo semantics
 - non-negative values for time, distance, and velocity
- Two dimensions: distance and time
- Many units: distance (inches, kilometers, miles), time (milliseconds, hours), velocity (kph, mph)
- And interaction among components

How should we model?

- Designer needs to consider units and conversions between them to manipulate the model
- One approach: Model units as sets, and conversions as constructed types projections.
- Example :
 - 1 $estimateVelocity \in \texttt{MILES} \times \texttt{HOURS} \rightarrow \texttt{MPH}$
 - $2 mphTokph \in MPH \rightarrow KPH$

Sample Velocity Estimation

time

Listing 1 - Bug bug0

```
#include <stdio.h>
#include <stdib.h>
#include <time.h>
int main() {
   int x. y;
   // Seed the random number generator with the current time
   srand(time(NULL));
   // Generate a random number between 1 and 100
   x = rand() % 100 + 1;
   // Perform some calculations
   y = x / (100 - x);
   printf("Result: %d\n", y);
   return 0;
}
```

Listing 2 - Bug bug00

```
// Heisenbug
#include < stdio.h>
#include < stdlib . h>
#include <time.h>
int main() {
  int x, y, i=0;
    for (i = 0; i \le 100000; i++) {
    // Seed the random number generator with the current time
    srand(time(NULL));
    // Generate a random number between 1 and 100
    x = rand() \% 100 + 1;
        printf("Result: -x=--%d\n",x);
    // Perform some calculations
    y = x / (100 - x);
    printf("Result: -i=%d - -%d\n", i, y);
    return 0;
```

Listing 3 – Bug bug000

```
// Heisenbug
#include <stdio.h>
#include < stdlib . h>
#include <time.h>
int main() {
  int x, y, i=0;
    for (i = 0; i \le 100; i++) {
    // Seed the random number generator with the current time
    srand(time(NULL)+i);
    // Generate a random number between 1 and 100
    x = rand() \% 100 + 1;
        printf("Result: -x=--%d\n",x);
    // Perform some calculations
    y = x / (100 - x);
    printf("Result: -i=%d - -%d\n", i, y);
    return 0;
```

Current Summary

- 7 Examples of Event B models
- 8 Summary on Events

Observing the safe system

- The context defines the possible values
- Safety requirement means that something bad will never happen.
- Invariant defines the set of effective possible values
- Transitions modify state variables and maintains the invariant.

Observing the unsafe system

- Transitions modify state variables and may not maintain the invariant.
- ... and may not guaranteesafety properties.

Tools

- Event B : http ://www.event-b.org/
- Atelier B : http ://www.atelierb.eu/
- RODIN Platform : http://www.event-b.org/platform.html

The Event B Method

- The Event B Method is invented by J.-R. Abrial from 1988 : abstract system, events, refinement, invariant.
- Atelier B and RODIN are supporting the Event B method
- An event is observed and triggered, when a guard is true
- Proof obligations are generated using the weakest-precondition semantics.
- A Event B model intends to model a reactive system.

Current Summary

A Simple Example

Managing teachers, students, lectures and class rooms

- Modelling the access control of students for lectures given by teachers
- When a student is attending a lecture, he/she can not attend another lecture
- When a teacher is lecturing, he/she is not lecturing another session.
- A student can not be lecturing without a teacher and when he is not attending a lecture, he is outside the classroom.
- When a teacher is ending a lecture, every student which is attending, is leaving the class room.
- When a student is not attending a lecture, he is free.

First step: identification of sets, constants, properties

- Sets: students, teachers
- Property 1: When a student is attending a lecture, he/she can not attend another lecture
- Property 2: When a teacher is lecturing, he/she is not lecturing another session.
- **Property 3**: A student can not be lecturing without a teacher and when he is not attending a lecture, he is outside the classroom.
- **Property 4 :** When a teacher is ending a lecture, every student which is attending, is leaving the class room.
- Property 5: When a student is not attending a lecture, he is free.

Second step: definition of state variables

- The system model should be able to record the lecturing teachers and the attending students.
- The system model should be enough expressive to state when a given student is attending a lecture given by whom.
- Variable attending records students which atteding some lecture with a given teacher.
- Variable islecturing records teachers who are lecturing.
- Variable pause records sudents are not attending a lecture but are somewhere not in a lecture.

Third step: properties of state variables

Expression of the invariant

```
 \begin{split} &inv1: attending \in STUDENTS \to TEACHERS \\ &inv2: islecturing \subseteq TEACHERS \\ &inv3: \forall e \cdot e \in STUDENTS \land e \in dom(attending) \\ & \Rightarrow \quad attending(e) \in islecturing \\ &inv4: pause \subseteq STUDENTS \\ &inv5: pause \cap dom(attending) = \varnothing \\ &inv6: pause \cup dom(attending) = STUDENTS \end{split}
```

Checking proof obligations!

UseCases

- EVENT INITIALISATION : initializing state variables
- EVENT startingattending: a group of students is moving from pause to lecture
- EVENT teachergivinglecture : a teacher is starting a new lecture
- EVENT teacherendinglecture : a teacher is halting the lecture
- **EVENT** studentleavinglecture : a group of students is moving from *lecture* to *pause*

EVENT INITIALISATION

BEGIN

 $\begin{array}{ll} act1: \ attending := \varnothing \\ act2: \ islecturing := \varnothing \\ act3: \ pause := STUDENTS \\ \hline {\bf END} \\ \end{array}$

```
EVENT startingattending ANY e e is a student p p is a teacher WHERE grd1: e \in STUDENTS grd3: p \in TEACHERS grd4: p \in islecturing grd2: e \notin dom(attending) THEN act1: attending(e) := p act2: pause := pause \setminus \{e\} END
```

```
EVENT teachergiving lecture 
ANY p WHERE grd2: p \in TEACHERS grd1: p \notin is lecturing THEN act1 is lecturing := is lecturing \cup \{p\} END
```

```
EVENT teacherendinglecture 

ANY
p
WHERE
grd1: p \in TEACHERS
grd2: p \in islecturing
THEN
act1: islecturing := islecturing \setminus \{p\}
act3: attending := attending \setminus \{f \mapsto q | \begin{pmatrix} f \in STUDENTS \\ \land q \in TEACHERS \\ \land f \mapsto q \in attending \\ \land q = p \end{pmatrix}
act2: pause := pause \cup \{f | f \in STUDENTS \land f \in attending^{-1}[\{p\}]\}
END
```

```
EVENT studentleavinglecture 

ANY ge
WHERE grd1: ge \subseteq dom(attending)
grd2: ge \neq \varnothing
THEN act1: attending := ge \lessdot attending
act2: pause := pause \cup ge
END
```

Mathematical tools for modelling systems

- set theory : sets, relations, functions . . .
- transition systems
- predicate calculus
- decision procedures
- interactive theorem prover

Current Summary

- Documentation

- Modelling Language
- A Simple Example : Management of Students and Teachers
- **5** Modelling state-based systems
- **6** The Event B modelling language
- Texamples of Event B models
- 8 Summary on Events

Modelling systems

- A system is observed
- Observation of things which are
 - either changing over the time (variable)
 - or stuttering over the time (constant)
- A system is characterized by a state
- A state is made up of contextual constant informations over the problem theory and of modifiable flexible informations over the system.

A **flexible variable** x is observed at different instants :

$$x_0 \stackrel{\tau}{\to} x_1 \stackrel{\tau}{\to} x_2 \stackrel{\tau}{\to} x_3 \stackrel{\tau}{\to} \dots \stackrel{\tau}{\to} x_i \stackrel{\tau}{\to} x_{i+1} \stackrel{\tau}{\to} \dots$$

hides effectives changes of state or actions or event

$$x_0 \stackrel{\alpha_1}{\to} x_1 \stackrel{\alpha_2}{\to} x_2 \stackrel{\alpha_3}{\to} x_3 \stackrel{\alpha_4}{\to} \dots \stackrel{\alpha_i}{\to} x_i \stackrel{\alpha_{i+1}}{\to} x_{i+1} \stackrel{\alpha_{i+2}}{\to} \dots$$

Occurences of e au can be added between two instants ie stuttering steps :

$$x_0 \stackrel{\alpha_1}{\to} x_1 \stackrel{\alpha_2}{\to} x_2 \stackrel{\tau}{\to} x_2 \stackrel{\alpha_3}{\to} x_3 \stackrel{\alpha_4}{\to} \dots \stackrel{\alpha_i}{\to} x_i \stackrel{\tau}{\to} x_i \stackrel{\alpha_{i+1}}{\to} x_{i+1} \stackrel{\alpha_{i+2}}{\to} \dots$$

A **flexible variable** x is observed at different instants: $x_0 \stackrel{\tau}{\to} x_1 \stackrel{\tau}{\to} x_2 \stackrel{\tau}{\to} x_3 \stackrel{\tau}{\to} \dots \stackrel{\tau}{\to} x_i \stackrel{\tau}{\to} x_{i+1} \stackrel{\tau}{\to} \dots$ τ hides effectives changes of state or actions or events

Occurences of e au can be added between two instants ie stuttering steps :

 $x_0 \stackrel{\alpha_1}{\to} x_1 \stackrel{\alpha_2}{\to} x_2 \stackrel{\tau}{\to} x_2 \stackrel{\alpha_3}{\to} x_3 \stackrel{\alpha_4}{\to} \dots \stackrel{\alpha_i}{\to} x_i \stackrel{\tau}{\to} x_i \stackrel{\alpha_{i+1}}{\to} x_{i+1} \stackrel{\alpha_{i+2}}{\to}$

A **flexible variable** \boldsymbol{x} is observed at different instants :

$$x_0 \xrightarrow{\tau} x_1 \xrightarrow{\tau} x_2 \xrightarrow{\tau} x_3 \xrightarrow{\tau} \dots \xrightarrow{\tau} x_i \xrightarrow{\tau} x_{i+1} \xrightarrow{\tau} \dots$$

au hides effectives changes of state or actions or events

$$x_0 \stackrel{\alpha_1}{\to} x_1 \stackrel{\alpha_2}{\to} x_2 \stackrel{\alpha_3}{\to} x_3 \stackrel{\alpha_4}{\to} \dots \stackrel{\alpha_i}{\to} x_i \stackrel{\alpha_{i+1}}{\to} x_{i+1} \stackrel{\alpha_{i+2}}{\to} \dots$$

Occurrences of e τ can be added between two instants ie stuttering steps :

 $x_0 \stackrel{\alpha_1}{\to} x_1 \stackrel{\alpha_2}{\to} x_2 \stackrel{\tau}{\to} x_2 \stackrel{\alpha_3}{\to} x_3 \stackrel{\alpha_4}{\to} \dots \stackrel{\alpha_i}{\to} x_i \stackrel{\tau}{\to} x_i \stackrel{\alpha_{i+1}}{\to} x_{i+1} \stackrel{\alpha_{i+2}}{\to} \dots$

A flexible variable x is observed at different instants : $x_0 \stackrel{\tau}{\to} x_1 \stackrel{\tau}{\to} x_2 \stackrel{\tau}{\to} x_3 \stackrel{\tau}{\to} \dots \stackrel{\tau}{\to} x_i \stackrel{\tau}{\to} x_{i+1} \stackrel{\tau}{\to} \dots$ τ hides effectives changes of state or actions or events $x_0 \stackrel{\alpha_1}{\to} x_1 \stackrel{\alpha_2}{\to} x_2 \stackrel{\alpha_3}{\to} x_3 \stackrel{\alpha_4}{\to} \dots \stackrel{\alpha_i}{\to} x_i \stackrel{\alpha_{i+1}}{\to} x_{i+1} \stackrel{\alpha_{i+2}}{\to} \dots$ Occurences of e τ can be added between two instants ie stuttering steps :

A **flexible variable** x is observed at different instants: $x_0 \stackrel{\tau}{\to} x_1 \stackrel{\tau}{\to} x_2 \stackrel{\tau}{\to} x_3 \stackrel{\tau}{\to} \dots \stackrel{\tau}{\to} x_i \stackrel{\tau}{\to} x_{i+1} \stackrel{\tau}{\to} \dots$ τ hides effectives changes of state or actions or events $x_0 \stackrel{\alpha_1}{\to} x_1 \stackrel{\alpha_2}{\to} x_2 \stackrel{\alpha_3}{\to} x_3 \stackrel{\alpha_4}{\to} \dots \stackrel{\alpha_i}{\to} x_i \stackrel{\alpha_{i+1}}{\to} x_{i+1} \stackrel{\alpha_{i+2}}{\to} \dots$ Occurences of e τ can be added between two instants ie **stuttering steps**: $x_0 \stackrel{\alpha_1}{\to} x_1 \stackrel{\alpha_2}{\to} x_2 \stackrel{\tau}{\to} x_2 \stackrel{\alpha_3}{\to} x_3 \stackrel{\alpha_4}{\to} \dots \stackrel{\alpha_i}{\to} x_i \stackrel{\tau}{\to} x_i \stackrel{\alpha_{i+1}}{\to} x_{i+1} \stackrel{\alpha_{i+2}}{\to} \dots$

Properties of system

A safety property S over x states that something will not happen : S(x) means that S holds for x

An **invariant** property I over x states a strong safety property

Checking the relation

- You can check for every i in $\mathbb N$ that $S(x_i)$ is true but it can be long if states are different
- You can compute an abstraction of the set of states
- You can try to prove and for instance the induction principle may be usefull
- So be carefull and improve your modelling before to run the checker
- Use the induction

State properties of a system

- A state property namely P(x) is a first order predicate with free variables x, where x is a flexible variable.
- A flexible variable x has a current value x, a next value x', an initial value x_0 and possibly a final value x_f .
- A predicate P(x) is considered as a set of values v such that P(v) holds : set-theoretical interpretation

State Properties

Safety Property

A safety property states that nothing bad can happen.

Example

Safety Properties

- Partial correctness a component is correct wit respect to a precondition and a postcondition.
- No Run Time Error any software action or event does not produce a run-time error as overflow, division by zero . . .
- Mutual exclusion a set of processes share common ressources, a printer is shared by users, . . .
- Deadlock freedom the system is never blocked, there is always at least one next state, ...

Relation/action over states

 An action α over states is a relation between values of state variables before and values of variables after

$$\alpha(x,x')$$
 or $x \xrightarrow{\alpha} x'$

- Flexible variable x has two values x and x'.
- Priming flexible variables is borrowed from TLA
- Hypothesis 1 : Values of x belongs to a set of values called VALUES and defines the context of the system.
- Hypothesis 2 : Relations over x and x' belong to a set of relations $\{r_0,\dots,r_n\}$

Operational model of a system

- A system S is observed with respect to flexible variables x.
- Flexible variables x of S are modified according to a finite set of relations over the set of values $VALUES: \{r_0, \ldots, r_n\}$
- INIT(x) denotes the set of possible intial values for x.

$$\mathcal{OMS} = (x, Values, Init(x), \{r_0, \dots, r_n\})$$

Safety and invariance of system

- Hypothesis 3 : $\mathcal{OMS} = (x, \text{VALUES}, \text{INIT}(x), \{r_0, \dots, r_n\})$
- Hypothesis 4: $x \longrightarrow x' \stackrel{\triangle}{=} (x \ r_0 \ x') \lor \ldots \lor (x \ r_n \ x')$
- I(x) is inductively invariant for a system called S, if $\begin{cases} \forall x \in \text{Values} : \text{Init}(x) \Rightarrow \text{I}(x) \\ \forall x, x' \in \text{Values} : \text{I}(x) \land x \longrightarrow x' \Rightarrow \text{I}(x') \end{cases}$
 - I(x) is called an invariant in B
- Q(x) is a safety property for a system called S, if $\forall x, y \in \text{VALUES} : \text{INIT}(x) \land x \xrightarrow{\star} y \Rightarrow Q(y)$ Q(x) is called a theorem in B

Modelling systems : first attempt

```

```

- A model has a name m
- Flexibles variables x are declared
- I(x) provides informations over x
- ullet Q(x) provides informations over x

Checking safety properties of the model

- $\forall x_0, x \in \text{Values} : \text{Init}(x_0) \land x_0 \xrightarrow{\star} x \Rightarrow Q(x)$
- Solution 1 Writing a procedure checking INIT $(x_0) \wedge x_0 \xrightarrow{\star} x \Rightarrow Q(x)$ for each pair $x_0, x \in VALUES$, when VALUES is finite and small.
- Solution 2 Writing a procedure checking INIT $(x_0) \land x_0 \xrightarrow{\star} x \Rightarrow Q(x)$ for each pair $x_0, x \in VALUES$, by constructing an abstraction of VALUES.
- Solution 3 Writing a proof for $\forall x_0, x \in \text{VALUES} : \text{INIT}(x_0) \land x_0 \xrightarrow{\star} x \Rightarrow Q(x).$

Defining an induction principle for an operational model

(I)
$$\forall x_0, x \in \text{Values} : \text{Init}(x_0) \land x_0 \xrightarrow{\star} x \Rightarrow \mathbf{Q}(x)$$

if, and only if,

(II) there exists a state property I(x) such that :

$$\forall x_0, x, x' \in \mathsf{Values} : \{ (1) \ \mathsf{Init}(x_0) \Rightarrow \mathsf{I}(x_0) \\ (2) \ \mathsf{I}(x) \Rightarrow \mathsf{Q}(x) \}$$

$$\forall x_0, x, x' \in \mathbf{Values} : \left\{ \begin{array}{ll} (1) & \mathbf{Init}(x_0) \Rightarrow \mathbf{I}(x_0) \\ (2) & \mathbf{I}(x) \Rightarrow \mathbf{Q}(x) \\ (3) & \mathbf{I}(x) \land x \longrightarrow x' \Rightarrow \mathbf{I}(x') \end{array} \right.$$

if, and only if,

(III) there exists a state property I(x) such that :

(1)
$$\operatorname{Init}(x_0) \Rightarrow \operatorname{I}(x_0)$$

$$\forall x_0, x, x' \in \mathsf{Values} : \{ (2) \mid \mathsf{I}(x) \Rightarrow \mathsf{Q}(x) \}$$

$$(2) \quad \mathbf{I}(x) \Rightarrow \mathbf{Q}(x)$$

$$\forall x_0, x, x' \in \textbf{Values}: \left\{ \begin{array}{ll} (1) & \textbf{Init}(x_0) \Rightarrow \textbf{I}(x_0) \\ (2) & \textbf{I}(x) \Rightarrow \textbf{Q}(x) \\ (3) & \forall i \in \{0, \dots, n\}: \textbf{I}(x) \land x \ r_i \ x' \Rightarrow \textbf{I}(x') \end{array} \right.$$

Modelling systems : second attempt

```
\begin{tabular}{ll} MODEL & m & & & \\ & \cdots & & & \\ & \cdots & & & \\ & VARIABLES & & \\ & x & & & \\ INVARIANT & & \\ & I(x) & & \\ & THEOREMS & & \\ & Q(x) & & \\ & INITIALISATION & \\ & Init(x) & & \\ & EVENTS & & \\ & \{r_0, \dots, r_n\} & \\ & END & & \\ \end{tabular}
```

- $\forall x_0 \in \text{Values} : \text{Init}(x_0) \Rightarrow \text{I}(x_0)$
- $\forall x, x' \in \text{Values} : \forall i \in \{0, \dots, n\} :$ $I(x) \land x \ r_i \ x' \Rightarrow I(x')$
- $\forall x \in \text{Values} : I(x) \Rightarrow Q(x)$

Modelling systems : last attempt?

- What are the environment of the proof for properties?
- What are theories?
- How are defining the static objects?

Modelling systems : last attempt!

$\begin{array}{c} \textbf{MODEL} \\ m \\ \Gamma(m) \\ \textbf{VARIABLES} \\ x \\ \textbf{INVARIANT} \\ I(x) \\ \textbf{THEOREMS} \\ Q(x) \\ \textbf{INITIALISATION} \\ Init(x) \\ \textbf{EVENTS} \\ \{r_0, \dots, r_n\} \\ \textbf{END} \end{array}$

- $\Gamma(m)$ defines the static environment for the proofs related to m.
- $\Gamma(m) \vdash \forall x \in \text{Values} : \text{Init}(x) \Rightarrow \text{I}(x)$
- $\forall i \in \{0, \dots, n\}$: $\Gamma(m) \vdash \forall x, x' \in \text{Values} : I(x) \land x \ r_i \ x' \Rightarrow I(x')$
- $\Gamma(m) \vdash \forall x \in \text{Values} : I(x) \Rightarrow Q(x)$

Events System Models

An event system model is made of

State **constants** and state **variables** constrained by a state **invariant**

A finite set of events

Proofs ensures the consistency between the invariant and the events An event system model can be **refined**

Proofs must ensure the correctness of refinement

Modelling systems : Hello world !

Telecom ancy 2024-2025 (Dominique Méry)

```

EVENTS $\{e_1,\ldots,e_n\}$ **FND**

• $\Gamma(m) \vdash Q(s,c)$

• $\Gamma(m) \vdash \forall x, x' \in \text{Values} : \text{Init}(s, c, x) \Rightarrow$ I(s,c,x)

defined from the static part.

• $\forall i \in \{0,\ldots,n\}: r_i(x,x') \stackrel{\Delta}{=} BA(e_i)(s,c,x,x')$

• $\Gamma(m)$ defines the static environment for the proofs

related to m from s, c and P(s,c) and $\Gamma(m)$ is

- $\forall i \in \{0, ..., n\}$: $\Gamma(m) \vdash \forall x, x' \in \text{VALUES}:$ $I(x) \wedge BA(e_i)(s, c, x, x') \Rightarrow \overline{I(s, c, x')}$
- $\Gamma(m) \vdash \forall x, x' \in \text{VALUES} : I(x) \Rightarrow S(s, c, x)$

Modelling systems

- **step 1**: Understanding the **problem** to solve
- step 2 : Organizing requirements and extracting properties
- step 3: Writing a first very abstract system model
- **step 4**: Consulting the requirements and **adding** a new detail in the current model by **refinement**
- **step 5**: Either the model is enough detailed and the process stops, or the model is not yet enough concrete and the step 4 is repeated.

Expressing models in the event B notation

- Models are defined in two ways :
 - an abstract machine
 - a refinement of an existing model
- Models use constants which are defined in structures called contexts
- B structures are related by the three possible relations :
 - the sees relationship for expressing the use of constants, sets satisfying axioms and theorems.
 - the extends relationship for expressing the extension of contexts by adding new constants and new sets
 - the refines relationship stating that a B model is refined by another one.

Machines and contexts

Machines

- REFINES
- SEES a context
- VARIABLES of the model
- INVARIANTS satisfied by the variables
- THEOREMS satisfied by the variables
- EVENTS modifying the variables
- VARIANT

Contexts

- EXTENDS another context
- SETS declares new sets
- CONSTANTS define a list of constants
- AXIOMS define the properties of constants and sets
- THEOREMS list the theorems which should be derived from axioms

Machines en Event B

```
MACHINE
 m
REFINES
 am
SEES
VARIABLES
INVARIANTS
 I(u)
THEOREMS
 Q(u)
VARIANT
  < variant >
EVENTS
  < event >
END
```

- $\Gamma(m)$: environment for the machine m defined by the context c
- $\Gamma(m) \vdash \forall u \in \text{Values} : \text{Init}(u) \Rightarrow \text{I}(u)$
- For each event e in E: $\Gamma(m) \vdash \forall u, u' \in \text{VALUES} : I(u) \land BA(e)(u, u') \Rightarrow I(u')$
- $\Gamma(m) \vdash \forall u \in \text{Values} : I(u) \Rightarrow Q(u)$

Contexts in Event B

- ac:c is extending ac and add new features
- s : sets are defined either by intension or by extension
- c : constants are defined and
- axioms characterize constants and sets
- theorems are derived from axioms in the current context

Events

Event : E	Before-After Predicate
$\textbf{BEGIN} \ x: P(x,x') \ \textbf{END}$	P(x,x')
WHEN $G(x)$ THEN $x: P(x,x')$ END	$G(x) \wedge P(x,x')$
ANY t WHERE $G(t,x)$ THEN $x: P(x,x',t) $ END	$\exists t \cdot (G(t,x) \land P(x,x',t))$

Guards of event

Event : E	Guard : grd(E)
BEGIN S END	TRUE
WHEN $G(x)$ THEN T END	G(x)
ANY t WHERE $G(t,x)$ THEN T END	$\exists t \cdot G(t, x)$

Proof obligations for a B model

	Proof obligation
(INV1)	$\Gamma(s,c) \vdash Init(x) \Rightarrow I(x)$
(INV2)	$\Gamma(s,c) \vdash I(x) \land BA(e)(x,x') \Rightarrow I(x')$
(DEAD)	$\Gamma(s,c) \vdash I(x) \Rightarrow (\operatorname{grd}(e_1) \lor \dots \operatorname{grd}(e_n))$
(SAFE)	$\Gamma(s,c) \vdash I(x) \Rightarrow A(x)$
(FIS)	$\Gamma(s,c) \; \vdash \; I(x) \; \land \; \operatorname{grd}\left(E\right) \; \Rightarrow \; \exists x' \cdot P(x,x')$

```

Communications between agents

```
\begin{array}{l} \textbf{EVENT loosing a messge} \\ \textbf{ANY} \\ a \\ b \\ \textbf{WHERE} \quad grd1: a \in AGENTS \\ grd2: b \in AGENTS \\ grd3: a \mapsto b \in sent \setminus (got \cup lost) \\ \textbf{THEN} \\ act1: lost := lost \cup \{a \mapsto b\} \\ \textbf{END} \\ \end{array}
```

```
CONTEXTS data SETS MESSAGES AGENTS DATA CONSTANTS n infile AXIOMS axm1: n \in \mathbb{N} axm2: n \neq 0 axm3: infile \in 1 ... n \rightarrow DATA END
```

Current Summary

- 1 Documentation
- 2 Introduction by Problems
- Modelling Language
- A Simple Example : Management of Students and Teachers
- **5** Modelling state-based systems
- **6** The Event B modelling language
- Texamples of Event B models
- 8 Summary on Events

General form of an event

```
\begin{aligned} & \textbf{EVENT e} \\ & \textbf{ANY} & t \\ & \textbf{WHERE} \\ & G(c,s,t,x) \\ & \textbf{THEN} \\ & x: |(P(c,s,t,x,x')) \\ & \textbf{END} \end{aligned}
```

- c et s are constantes and visible sets by e
- x is a state variable or a list of variabless
- G(c, s, t, x) is the condition for observing e.
- P(c, s, t, x, x') is the assertion for the relation over x and x'.
- BA(e)(c, s, x, x') is the before-after relationship for e and is defined by $\exists t. G(c, s, t, x) \land P(c, s, t, x, x')$.

General form of proof obligations for an event e

Proofs obligations are simplified when they are generated by the module called POG and goals in sequents as $\Gamma \vdash G$:

- **1** $\Gamma \vdash G_1 \land G_2$ is decomposed into the two sequents $\begin{array}{c} (1)\Gamma \vdash G_1 \\ (2)\Gamma \vdash G_2 \end{array}$
- 2 $\Gamma \vdash G_1 \Rightarrow G_2$ is transformed into the sequent $\Gamma, G_1 \vdash G_2$

Proof obligations in Rodin

- $INIT/I/INV : C(s,c), INIT(c,s,x) \vdash I(c,s,x)$
- $e/I/INV : C(s,c), I(c,s,x), G(c,s,t,x), P(c,s,t,x,x') \vdash I(c,s,x')$
- e/act/FIS : $C(s,c), I(c,s,x), G(c,s,t,x) \vdash \exists x'. P(c,s,t,x,x')$
