- **5** Organisation of the verification process
- **6** Conclusion

Summary on annotations and assertions

- requires
- assigns
- ensures
- decreases
- predicate
- ► logic
- ► lemma

Programming by contract

- ▶ The calling function should garantee the required condition or precondition introduced by the clauses requires $P1 \land \ldots \land Pn$ at the calling point.
- ▶ The called function returns results that are ensured by the clause ensures $E1 \land \ldots \land Em$; ensures clause exporess a relatrionship between the initial values of variables and the final values.
- \blacktriangleright initial values of a variable v is denoted $\backslash old(v)$
- ▶ The variables which are not in the set $L1 \cup ... \cup Lp$ are not modified.

```
Listing 1 — contrat

/*@ requires P1;...; requires Pn;
@ assigns L1;...; assigns Lm;
@ ensures E1;...; ensures Ep;
@*/
```

```
(Division) 
 Listing 2 — project-divers/annotation.c 

/*© requires x <= 0 & x >= 10;
@ assigns \nothing;
@ ensures x \% 2 = 0 \Rightarrow 2 * \text{result} = x;
@ ensures x \% 2 = 0 \Rightarrow 2 * \text{result} = x-1;
@ */
int annotation(int x)
{
int y;
y = x / 2;
y = x / 2;
y = x / 2;
```

```
(Division)
                        Listing 3 – project-divers/annotationwp.c
/*0 requires 0 \le x & x \le 10;
  @ assigns \nothing;
  \emptyset ensures x \% 2 = 0 \Longrightarrow 2* \text{result} = x;
  \emptyset ensures x \% 2 != 0 \Longrightarrow 2* \text{result} \Longrightarrow x-1;
  @*/
int annotation (int x)
/*@ assert x % 2 == 0 \Longrightarrow 2* (x / 2) == x; */
/*@ assert x \% 2 != 0 \Longrightarrow 2* (x / 2) \Longrightarrow x-1; */
  int y;
/*@ \ assert \ x \% \ 2 == 0 \Longrightarrow 2* (x / 2) == x; */
/*@ assert x \% 2 != 0 \Longrightarrow 2* (x / 2) \Longrightarrow x-1; */
 y = x / 2;
/*@ \ assert \ x \% \ 2 = 0 \Longrightarrow 2*v = x; */
/*@ \ assert \ \ x \% 2 != 0 \Longrightarrow 2*v \Longrightarrow x-1; */
  return(y);
/*@ \ assert \ x \% \ 2 = 0 \Longrightarrow 2*v = x; */
/*@ \ assert \ \ x \% 2 != 0 \Longrightarrow 2*y == x-1; */
```

Examples of contract (1)

Property to check

$$x \ge 0 \land x < 0; \Rightarrow \left(\begin{array}{ccc} x \% & 2 & = & 0 \Rightarrow 2 \cdot (x/2) = x \\ x \% & 2 & \neq & 0 \Rightarrow 2 \cdot (x/2) = x - 1 \end{array}\right)$$

```
Listing 4 - project-divers/annotation0.c

/*@ requires x >= 0 && x < 0;
@ assigns \nothing;
@ ensures \result = 0;
@ */
int annotation0(int x)
{
int y;
y = y / (x-x);
return(y);
}
```

```
(Precondition)
                 Listing 5 - project-divers/annotation0wp.c
/*@ requires x >= 0 \&\& x < 0;
 @ assigns \nothing;
 @ ensures \ result == 0;
int annotation (int x)
 /*@ \ assert \ y \ / \ (x-x) = 0; \ */
 int y;
 /*0 assert y / (x-x) = 0; */
 y = y / (x-x);
 /*@ assert y == 0; */
  return(y);
  /*@ assert y == 0; */
```

Examples of contract (2)

Property to check
$$0 \le x \land x \le 10 \Rightarrow y/(x-x) = 0$$

Definition of a contract (specification)

- ▶ Define the mathematical fucntion to compute (what to compute?)
- ▶ Define an inductive method for computing the mathematical function and using axioms.

```
(facctorial what)
                    Listing 6 – project-factorial/factorial.h
#ifndef _A_H
#define _A_H
/*@ axiomatic mathfact {
  @ logic integer mathfact(integer n);
  @ axiom mathfact_1: mathfact(1) == 1:
  @ axiom mathfact_rec: \forall integer n; n > 1
  \implies mathfact(n) \implies mathfact(n-1);
  @ } */
/*0 requires n > 0;
  decreases n;
  ensures \result == mathfact(n);
  assigns \nothing;
int codefact(int n);
#endif
```

Definition of a contract (programming)

- Define the program codefact for computing mathfact (How to compute?)
- ▶ Define the algorithm computing the function mathfact

```
(facctorial how )
                    Listing 7 – project-factorial/factorial.c
#include "factorial.h"
int codefact(int n) {
  int y = 1;
  /*@ loop invariant x >= 1 \&\& x <= n \&\& mathfact(n) == y * mathfact(x);
    loop assigns x, y;
    loop variant x;
  while (x != 1) {
    y = y * x;
    x = x - 1;
  return y;
```

Definition of a contract (approach)

- ► The specification of a function (mathfact) to compute requires to define it mathematically.
- ► The definition is stated in an axtiomatic framework and is preferably inductive (mathfact) which is used in assrtions or theorems or lemmas.
- ► The relationship between the ciomputed value (\result) and the mathematical value (mathfact(n)) is stated in the ensures clause :
- ► The main property to prove is codefact(n)==mathfact(n) : Calling codefact for n returns a value equal to mathfact(n).

```
Listing 8 - contrat
/*@ requires P;
@ behavior b1:
  @ assumes A1:
  @ requires R1;
  @ assigns L1;
  @ ensures E1:
@ behavior b2:
  @ assumes A2;
  @ requires R2;
  @ assigns L2;
  @ ensures E2:
@*/
```

Division should not return silly expressions!

```
(Pairs of integers)

Listing 9 — project-divers/structures.h

#ifndef _STRUCTURE.H

struct s {
   int q;
   int r;
};

#endif
```

```
(Specification)
                     Listing 10 – project-divers/division.h
#ifndef _A_H
#define _A_H
#include "structures.h"
/*0 requires a >= 0 \&\& b >= 0:
O hehavior b :
  @ assumes b == 0:
  @ assigns \nothing;
  @ ensures \result.q = -1 && \result.r = -1;
@ behavior B2:
  @ assumes b != 0:
  @ assigns \nothing;
  Q ensures 0 \le |result.r|
  @ ensures \ result . r < b:
  @ ensures a == b * \result.q + \result.r;
struct s division (int a, int b);
#endif
```

```
(Algorithm)
                     Listing 11 – project-divers/division.c
#include < stdio.h>
#include < stdlib .h>
#include "division.h"
struct s division (int a, int b)
\{ int rr = a; 
   int qq = 0;
   struct s silly = \{-1,-1\};
   struct s resu:
   if (b = 0) {
     return silly;
   else
  /+0
    loop invariant
    (a = b*qq + rr) &&
    rr >= 0:
    loop assigns rr,qq;
    loop variant rr;
   while (rr >= b) { rr = rr - b; qq=qq+1;};
   resu.q= qq;
   resu.r = rr;
  return resu;
```

Iteration Rule for PC

If $\{P \wedge B\}$ **S** $\{P\}$, then $\{P\}$ while **B** do **S** od $\{P \wedge \neg B\}$.

- ▶ Prove $\{P \land B\}$ **S** $\{P\}$ or $P \land B \Rightarrow \{S\}(P)$.
- ▶ By the iteration rule, we conclude that $\{P\}$ while **B** do **S** od $\{P \land \neg B\}$ without using WLP.
- ▶ Introduction of LOOP INVARIANTS in the notation.

```
Listing 12 - loop.c

/*@ loop invariant I1;
loop invariant I2;
...
```

```
loop invariant 12;
...
loop invariant In;
loop assigns X;
loop variant E;
*/
```

```
(Invariant de boucle)
                      Listing 13 – project-divers/anno6.c
/*@ requires a >= 0 && b >= 0;
 ensures 0 \le |result|;

}
```

Two Memory Models

- ► Hoare Model : -wp hoare is the option of frama-c
- ► Typed Model : default model is typed model

- ▶ It simply maps each C variable to one pure logical variable.
- Heap cannot be represented in this model, and expressions such as
 *p cannot be translated at all.
- ➤ You can still represent pointer values, but you cannot read or write the heap through pointers.

Typed Model

- ► The default model for WP plug-in.
- Heap values are stored in several separated global arrays, one for each atomic type (integers, floats, pointers) and an additional one for memory allocation.
- ▶ Pointer values are translated into an index into these arrays.
- ▶ all C integer types are represented by mathematical integers and each pointer type to a given type is represented by a specific logical abstract datatype.

Defining domain properties in logical theory

predicate

```
(Predicate)
```

Listing 32 – project-divers/predicate1.c

```
/*@ predicate is_positive(integer x) = x > 0; */
/*@ logic integer get_sign(real x) = @ x > 0.0?1:(x<0.0?-1:0); */
*@ logic integer max(int x, int y) = x=y?x:y; */
```

(Lemma)

Listing 33 – project-divers/lemma1.c

```
/*© lemma div.mul.identity: 

@ \forall real x, real y; y != 0.0 \Longrightarrow y*(x/y) \Longrightarrow x; @*/
/*© lemma div.qr: 

@ \forall int a, int b; a >= 0 && b >0 \Longrightarrow 

\exists int q, int r; a \Longrightarrow b*q+r && 0<=r && r <b; @*/
```

```
(Definition of fibonacci function)

Listing 34 — project-divers/predicate2.c

/*@ axiomatic mathfibonacci{
    @ logic integer mathfib(integer n);
    @ axiom mathfib0: mathfib(0) = 1;
    @ axiom mathfib1: mathfib(1) = 1;
    @ axiom mathfib1: mathfib(1) = 1;
    @ axiom mathfibrec: \forall integer n; n > 1

mathfib(n) = mathfib(n-1)+mathfib(n-2);
    @ } */
```

Loop termination

- ▶ The termination is proved by shoiwing that eaxg loop terminates.
- Any loop is characterized by an expression expvariant(x) called variant which should decrease each execution of the body:

```
\forall x_1, x_2.b(x_1) \land x_1 \xrightarrow{\mathsf{S}} x_2 \Rightarrow \mathsf{expvariant}(x_1) > \mathsf{expvariant}(x_2)
```

```
(Variant)
                    Listing 37 – project-divers/variant1.c
/*@ requires n > 0;
  terminates n > 0:
  ensures \result == 0:
int code(int n) {
 /*@ loop invariant x >= 0 \&\& x <= n;
    loop assigns x;
    loop variant x;
  while (x != 0) {
    x = x - 1;
  return x;
```

```
(Variant)
                    Listing 38 - project-divers/variant3.c
int f() {
int x = 0:
int y = 10;
/*@
    loop invariant
   0 <= x < 11 \&\& x+y == 10;
   loop variant y;
while (y > 0) {
 x++:
  y---:
 return 0;
```

- ► lemma : 1 VC
- ► axiom : no VC (admitted with no proof)
- ensures : 1 VC
- ► exits : 1 VC
- disjoint : 1 VC
- ► complete : 1 VC
- ► requires : 1 VC for each call
- terminates : 1 VC for each call, 1 VC for each loop without "loop variant"
- decreases : 1 VC for each recursive call
- assigns : 1 VC for each assigned Ivalue
- admit : no VC (admitted with no proof)
- ► assert/check : 1 VC
- ► loop invariant : 2 VCs (established, preserved)
- ► loop variant (integer) : 2 VCs (positive, decreasing)
- ► loop variant (general measure) : 1 VC (the measure is assumed to be well-founded) loop assigns : 1 VC for each assigned Ivalue

- ▶ Defining th mathematical function to compute *mathf*
- Stating the postcondition using the mathematical function
- \blacktriangleright Evaluating the inductive sequence u_i computing the function mathf
- $\triangleright \forall i \in \mathbb{N} : u_i = marthf(i)$
- ► Evaluating relationship among variables.

```

```

Principles for RTE

- ▶ Plugin -rte adds specifi assertions for each variable
- ► Systematic checking of RTE.

- ▶ Defining domain properties (axioms, lemmas, proofs)
- ▶ Defining loop invariants (typing, equation, ...)
- ► Analyzing inductive properties
- ▶ Identifying inputs (requires) and outputs (ensures)
