Writing a simple contract

variables x

requires $x >= 0 \wedge x <= 10;$

ensures $\begin{cases} x\%2 = 0 & \Rightarrow & 2\cdot\text{result} = x+; \\ x\%2 \neq 0 & \Rightarrow & 2\cdot\text{result} = x-1; \end{cases}$

$$\begin{bmatrix} \text{begin} \\ int \ y; \\ y = x/2; \\ return(y); \\ \text{end} \end{bmatrix}$$

► result is the value returned by the command `rezturn(y)`.

► `return(y)` is equivalent to `result:= y`.

(Writing a simple contract.)

  int y;
  y = x / 2;
  return(y);
}

Programming by contract

▶ The calling function should garantee the required condition or precondition introduced by the clauses requires $P1 \wedge \ldots \wedge Pn$ at the calling point.

▶ The called function returns results that are ensured by the clause ensures $E1 \wedge \ldots \wedge Em$; ensures clause exporess a relatrionship between the initial values of variables and the final values.

▶ initial values of a variable v is denoted $\backslash old(v)$

▶ The variables which are not in the set $L1 \cup \ldots \cup Lp$ are not modified.

Property to check
$0 \leq x \wedge x \leq 10 \Rightarrow y/(x-x) = 0$

Definition of a contract (specification)

▶ Define the mathematical fucntion to compute (what to compute?)

▶ Define an inductive method for computing the mathematical function and using axioms.

(facctorial what)

Listing 12 – project-factorial/factorial.h

```
#ifndef _A_H
#define _A_H
/*@ axiomatic mathfact {
  @ logic integer mathfact(integer n);
  @ axiom mathfact_1: mathfact(1) == 1;
  @ axiom mathfact_rec: \forall integer n; n > 1
  ==> mathfact(n) == n * mathfact(n-1);
  @ } */

/*@ requires n > 0;
    decreases n;
    ensures \result == mathfact(n);
    assigns \nothing;
*/
int codefact(int n);
#endif
```

Definition of a contract (programming)

▶ Define the program codefact for computing mathfact (How to compute ?)

▶ Define the algorithm computing the function mathfact

---

(faccatorial how)

Listing 13 – project-factorial/factorial.c

```
#include "factorial.h"

int codefact(int n) {
    int y = 1;
    int x = n;
    /*@ loop invariant x >= 1 && x <= n && mathfact(n) == y * mathfact(x);
        loop assigns x, y;
        loop variant x;
     */
    while (x != 1) {
        y = y * x;
        x = x - 1;
    };
    return y;

}
```

- ▶ The specification of a function (mathfact) to compute requires to define it mathematically.

- ▶ The definition is stated in an axtiomatic framework and is preferably inductive (mathfact) which is used in assrtions or theorems or lemmas.

- ▶ The relationship between the ciomputed value (\result) and the mathematical value (mathfact(n)) is stated in the ensures clause :

$$\result == mathfact(n)$$

- ▶ The main property to prove is codefact(n)==mathfact(n) : Calling codefact for n returns a value equal to mathfact(n).

Iteration Rule for PC

If $\{P \wedge B\}\mathbf{S}\{P\}$, then $\{P\}$**while B do S od**$\{P \wedge \neg B\}$.

▶ Prove $\{P \wedge B\}\mathbf{S}\{P\}$ or $P \wedge B \Rightarrow \{\mathbf{S}\}(P)$.

▶ By the iteration rule, we conclude that
$\{P\}$**while B do S od**$\{P \wedge \neg B\}$ without using WLP.

▶ Introduction of LOOP INVARIANTS in the notation.
