Tutorial 4 : Checking annotated algorithms using Event-B
Dominique Méry
1$^{\text{er}}$ décembre 2025

Exercice 1 *contract-annotations*

For each case, define a contract for checking the soundness or the unsoundness of the annotation.

$$\forall x, y, , x', y'. P_\ell(x,y) \ \wedge \ cond_{\ell,\ell'}(x,y) \ \wedge \ (x',y') = f_{\ell,\ell'}(x,y) \Rightarrow P_{\ell'}(x',y')$$

You will use a context and a machine for expressing these conditions.

— $\ell_1 : x = 10 \ \wedge \ y = z+x \ \wedge z = 2{\cdot}x$
$\quad y := z+x$
$\quad \ell_2 : x = 10 \ \wedge \ y = x+2{\cdot}10$

— *We assume that p is a prime number.* $\ell_1 : x = 2^p \ \wedge \ y = 2^{p+1} \ \wedge \ x{\cdot}y = 2^{2\cdot p+1}$
$\quad x := y+x+2^x$
$\quad \ell_2 : x = 5{\cdot}2^p \ \wedge \ y = 2^{p+1}$

— $\ell_1 : x = 1 \ \wedge \ y = 12$
$\quad x := 2{\cdot}y$
$\quad \ell_2 : x = 1 \ \wedge \ y = 24$

— $\ell_1 : x = 11 \ \wedge \ y = 13$
$\quad z := x; x := y; y := z;$
$\quad \ell_2 : x = 26/2 \ \wedge \ y = 33/3$

Exercice 2 *(contract-simple)*

Let the following partially annotated algorithm :

> **precondition** $\quad : x = x_0 \wedge x_0 \in \mathbb{N}$
> **postcondition** $\quad : x = 0$
>
> $\ell_0 : \{ \ x = x_0 \wedge x_0 \in \mathbb{N}\}$
> **while** $0 < x$ **do**
> $\quad \mid \quad \ell_1 : \{O < x \leq x_0 \wedge x_0 \in \mathbb{N}\}$
> $\quad \mid \quad x := x-1;$
> $\quad \mid \quad \ell_2 : \{0 \leq x \leq x_0 \wedge x_0 \in \mathbb{N}\}$
>
> $;$
> $\ell_3 : \{x = 0\}$

Algorithme 1: Exercice 2

Question 2.1 *Translate each transition ℓ, ℓ' into an event modifying the variables according to the statements.*

Question 2.2 *Define an invariant attaching to each label an assertion satisfied at the control point.*

Question 2.3 *Verify proof obligations and deduce that the algorithm is partially correct.*

Question 2.4 *Prove that the algorithm has no runtime error.*

Exercice 3 *(contract-squareroot)*
Let the following annotated invariant.

---

precondition : $x \in \mathbb{N}$
postcondition : $z^2 \leq x \wedge x < (z+1)^2$
local variables : $y_1, y_2, y_3 \in \mathbb{N}$

$pre : \{x \in \mathbb{N}\}$
$post : \{z{\cdot}z \leq x \wedge x < (z+1){\cdot}(z+1)\}$
$\ell_0 : \{x \in \mathbb{N} \wedge z \in \mathbb{Z} \wedge y1 \in \mathbb{Z} \wedge y2 \in \mathbb{Z} \wedge y3 \in \mathbb{Z}\}$
$(y_1, y_2, y_3) := (0, 1, 1);$
$\ell_1 : \{y2 = (y1+1){\cdot}(y1+1) \wedge y3 = 2{\cdot}y1+1 \wedge y1{\cdot}y1 \leq x\}$
while $y_2 \leq x$ **do**

> $\ell_2 : \{y2 = (y1+1){\cdot}(y1+1) \wedge y3 = 2{\cdot}y1+1 \wedge y2 \leq x\}$
> $(y_1, y_2, y_3) := (y_1+1, y_2+y_3+2, y_3+2);$
> $\ell_3 : \{y2 = (y1+1){\cdot}(y1+1) \wedge y3 = 2{\cdot}y1+1 \wedge y1{\cdot}y1 \leq x\}$

;
$\ell_4 : \{y2 = (y1+1){\cdot}(y1+1) \wedge y3 = 2{\cdot}y1+1 \wedge y1{\cdot}y1 \leq x \wedge x < y2\}$
$z := y_1;$
$\ell_5 : \{y2 = (y1+1){\cdot}(y1+1) \wedge y3 = 2{\cdot}y1+1 \wedge y1{\cdot}y1 \leq x \wedge x < y2 \wedge z = y1 \wedge z{\cdot}z \leq x \wedge x < (z+1){\cdot}(z+1)\}$

Algorithme 2: *squareroot* annotée Exercice **??**

Question 3.1 *Translate each transition ℓ, ℓ' into an event modifying the variables according to the statements.*

Question 3.2 *Define an invariant attaching to each label an assertion satisfied at the control point.*

Question 3.3 *Verify proof obligations and deduce that the algorithm is partially correct.*

Question 3.4 *Prove that the algorithm has no runtime error.*

Exercice 4 *(contract-maximum)*
Soit l'algorithme suivant annoté partiellement :

Question 4.1 *Translate each transition ℓ, ℓ' into an event modifying the variables according to the statements.*

Question 4.2 *Define an invariant attaching to each label an assertion satisfied at the control point.*

Question 4.3 *Verify proof obligations and deduce that the algorithm is partially correct.*

Question 4.4 *Prove that the algorithm has no runtime error.*

/* algorithme de calcul du maximum avec une boucle while de l'exercice **??** */
